ANGULAR ASSIGNMENT : 04

Module 4: Data Binding – Multiple Assignment Questions

Section 1: Interpolation {{ }}

---

1. Display simple data using interpolation

Display name and city from component class in HTML.
Hint: Use {{ }} syntax.

---

2. Perform calculation using interpolation

Display result of addition directly in HTML.
Hint: {{ 10 + 20 }}.

---

3. Display dynamic date and time

Show current date and time using interpolation.
Hint: Use Date() object.

---

4. Bind object properties

Create object in TS and display its properties in HTML.
Hint: user.name, user.age.

---

5. Call function using interpolation

Create function in TS and call it in HTML.
Hint: {{ getMessage() }}.

Section 2: Property Binding [ ]

---

6. Bind image source dynamically

Display image using dynamic URL.
Hint: [src]="imageUrl".

---

7. Enable/Disable button dynamically

Disable button based on condition.
Hint: [disabled]="isDisabled".

---

8. Apply dynamic class

Apply class conditionally using property binding.
Hint: [class.active]="true".

---

9. Bind input value dynamically

Set default value of input field from TS.
Hint: [value]="username".

---

10. Change styles dynamically

Apply dynamic styles using property binding.
Hint: [style.color]="color".

Section 3: Event Binding ( )

---

11. Handle button click event

Display message on button click.
Hint: (click)="showMessage()".

---

12. Capture input value on typing

Log input value while typing.
Hint: (input)="getValue($event)".

---

13. Create counter using event binding

Increment and decrement counter on button click.
Hint: Use click events.

---

14. Show alert on mouse events

Handle mouseover and mouseout events.
Hint: (mouseover) and (mouseout).

---

15. Form submit handling

Handle form submit event.
Hint: (submit)="onSubmit()".

Section 4: Two-Way Binding [(ngModel)]

---

16. Bind input with ngModel

Create input field and bind it with variable.
Hint: [(ngModel)]="name".

---

17. Real-time data update

Display input value instantly while typing.
Hint: Two-way binding.

---

18. Create simple form using ngModel

Create form with name and email fields.
Hint: Bind both fields.

---

19. Sync checkbox state

Bind checkbox with variable.
Hint: Boolean value.

---

20. Dropdown binding

Bind selected value from dropdown.
Hint: [(ngModel)].

Section 5: FormsModule Setup

---

21. Import FormsModule

Enable ngModel in Angular app.
Hint: Import in app.module.ts.

---

22. Fix ngModel error

Solve error: “ngModel is not a known property”.
Hint: Missing FormsModule.

---

23. Use ngModel in multiple components

Apply FormsModule usage across components.
Hint: Module-level import.

---

24. Create user input form

Form with fields:

- Name
- Email
- Password

Hint: Use ngModel.

---

25. Validate input manually

Check if input is empty before submission.
Hint: Use condition in TS.

Section 6: Real World Practical Tasks

---

26. Login form using data binding

Create login form and capture user input.
Hint: Use ngModel + event binding.

---

27. Live preview feature

Display live preview of entered data.
Hint: Two-way binding.

---

28. Dynamic button control

Enable button only when input is valid.
Hint: Property binding.

---

29. Profile editor

Edit profile details and show updated data instantly.
Hint: ngModel.

---

30. Counter app with input control

User enters value and counter updates accordingly.
Hint: Combine bindings.

Section 7: Interview Thinking Questions

31. What is data binding in Angular?

Explain types with examples.

32. Difference between interpolation and property binding

Explain with use case.

33. What is two-way data binding?

Explain working of ngModel.

34. Why FormsModule is required?

Explain importance.

35. Difference between event binding and property binding

Explain clearly.
